

Traceability to National Standards

All measuring equipment consistently used on our production site are traceable to national standards or reference fixtures through our quality management system.

Traceability is established by recalibration at regular intervals with documentary evidence as specified in the standards.

The illustration that follows shows the hierarchy of calibrations within the chain of traceability. The example set for the transfer of accuracy to our MICRO-HITE height gauges also shows how they are calibrated. Each fixture is supplied with a free SCS calibration certificate issued by our laboratory officially accredited by the Swiss Calibration Service.
